TOPIC 18: D.C CIRCUITS

CHAPTER ANALYSIS

TIME

- Build up from Current Electricity
- 2 major key concepts
- Series Circuit, Parallel Circuit

• **Important** to get foundation right from Current Electricity

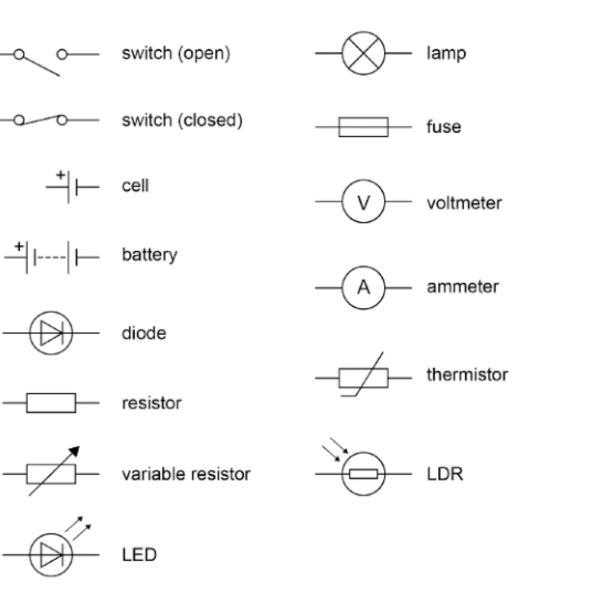

WEIGHTAGE

- Heavy-Medium overall weightage
- Constitute to around 5% of marks for past 5 year papers

KEY CONCEPT

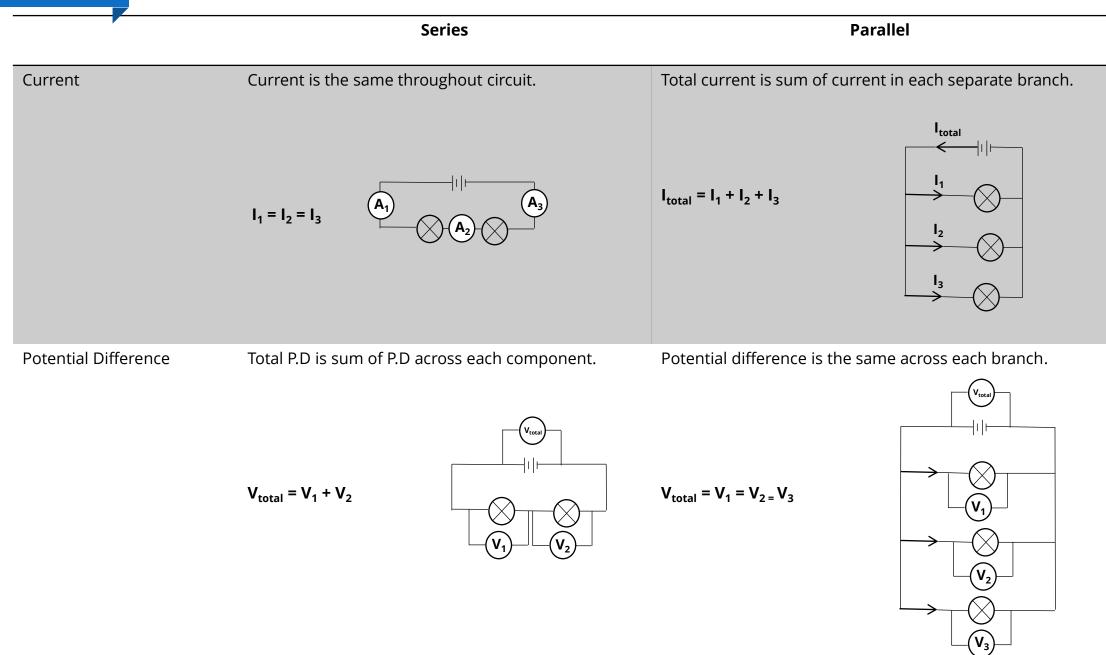

CIRCUIT DIAGRAM SERIES CIRCUIT PARALLEL CIRCUIT

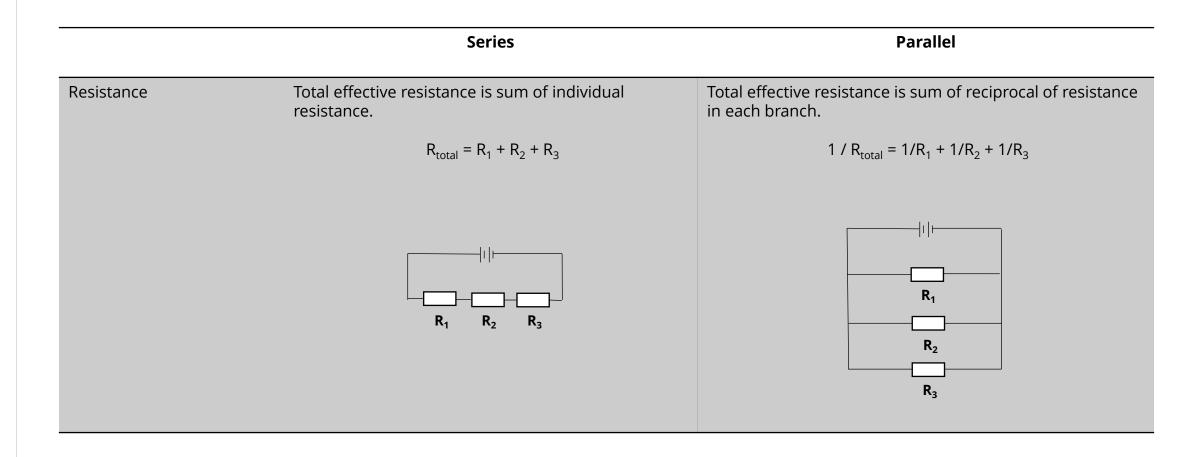

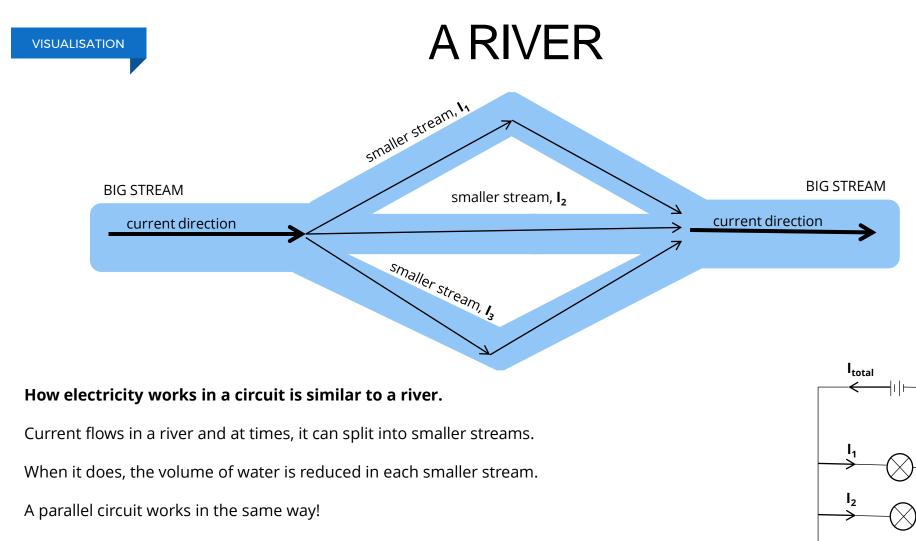

CIRCUIT DIAGRAMS

Familiarise yourself with the different components and their symbols!

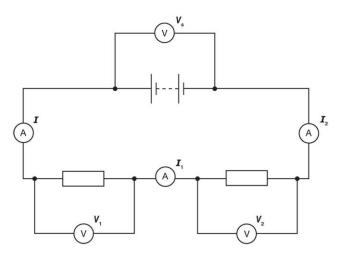

Current will split into smaller volume as it enters each individual branch of the circuit.

 $\mathbf{I}_{\text{total}} = \mathbf{I}_1 + \mathbf{I}_2 + \mathbf{I}_3$

SERIES CIRCUIT

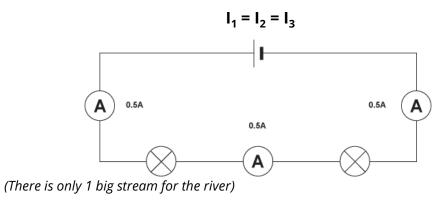

A **disadvantage** is that when one light bulb were to fuse, the entire circuit will no longer work.

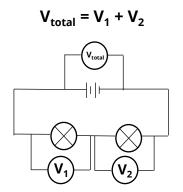

SERIES CIRCUIT

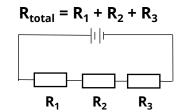

Current is the same throughout circuit.

Total potential difference is **sum of P.D** across each **component**, as the current has to pass through all the resistors.

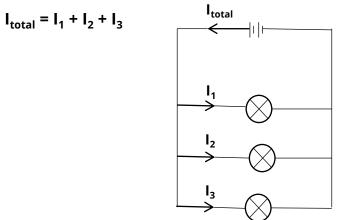

Total effective resistance is **sum** of **individual resistance**, as current has to pass through all the resistors.

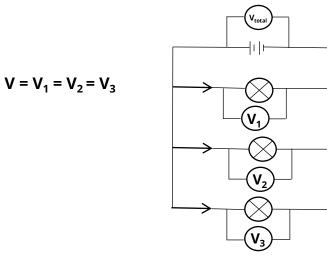

PARALLEL CIRCUIT

Total current is sum of current in each separate branch.

(*River splits into smaller streams, current will get divided as well*)

Potential difference is the same across each branch.

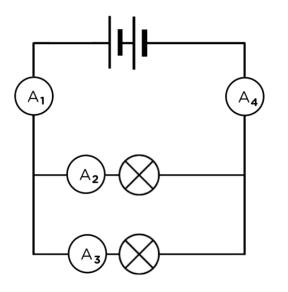

Total effective resistance is sum of reciprocal of resistance in each branch.

$$1 / R_{total} = 1/R_1 + 1/R_2 + 1/R_3$$

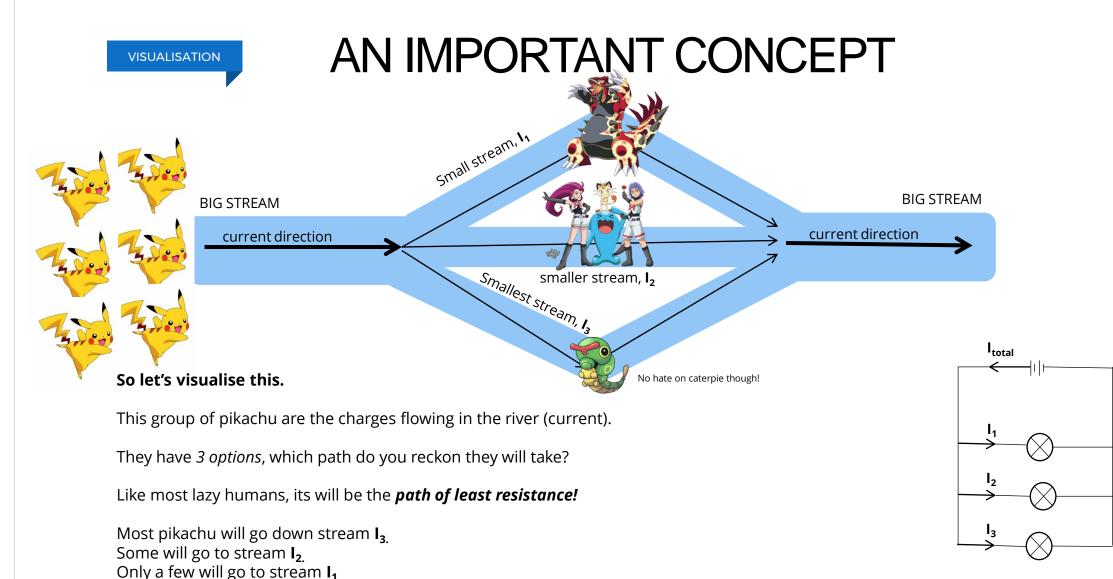

PARALLEL CIRCUIT

An **advantage** is that when one light bulb were to fuse the other parallel branches will still work.

9

 $I_1 = I_2 = I_3$ only when the reistance in each branch happens to be the same!

As current is the rate of flow of charges and charges tend to take the path of least resistance,

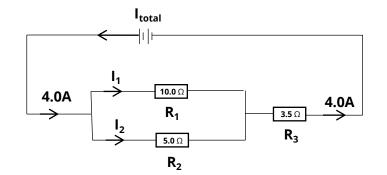

Current will split differently into each stream based on the amount of resistance in that branch.

10

PRACTICE QUESTION

How would the current split in this situation?

DARRELL ER (COPYRIGHTED) ©

RECALL

Current will split into different branches in parallel circuit.

 $\mathbf{I}_{\text{total}} = \mathbf{I}_1 + \mathbf{I}_2 + \mathbf{I}_3$

Due to path of resistance,

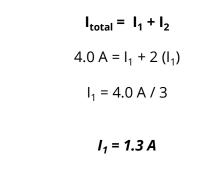

Current will split differently into each stream based on the amount of resistance in that branch.

HOW DO WE SOLVE THE QUESTION?

Recall that voltage across each parallel branch is constant, so since V = RI,

 $I_1 R_1 = I_2 R_2$ $I_1 \times 10.0 \Omega = I_2 \times 5.0 \Omega$ 2 (I₁) = I₂

 I_2 is twice the value of I_1 .

 $I_2 = 4.0 \text{ A} - 1.3 \text{A} = 2.7 \text{A}$

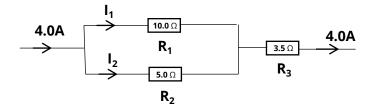

HOW DO WE SOLVE FOR THE EFFECTIVE RESISTANCE?

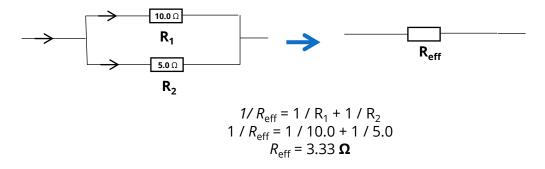

(Combined $R_1 \& R_2$ to simplify the circuit)

Using the same question, let's explore the resistance.

This is a case of a **parallel in a series circuit.**

(Since R_{eff} & R₃ are now technically in series)

 $R_{\rm total} = 3.33 \ \Omega + 3.5 \ \Omega = 6.83 \ \Omega$

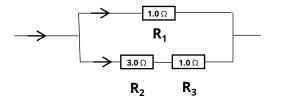

HENCE, MAKE THE PARALLEL INTO A SINGLE RESISTOR BEFORE CALCULATING TOTAL RESISTANCE.

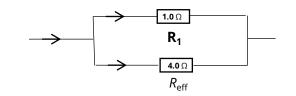

HOW DO WE SOLVE FOR THE EFFECTIVE RESISTANCE?

(Combined $R_{3,0} \& R_{1,0}$ to simplify the circuit)

SERIES IN PARALLEL

There is also series in parallel **circuit**.

 $R_{\rm eff}$ = 3.0 **Ω** + 1.0 **Ω** = 4.0 **Ω**

(Since R_{eff} & R₃ are now technically in parallel)

 $\frac{1}{R_{\text{total}}} = \frac{1}{R_{1.0}} + \frac{1}{R_{\text{eff}}}$ 1 / R_{total} = 1 / 1.0 + 1 / 4.0 R_{total} = 0.8 **Ω**

HENCE, MAKE THE SERIES INTO A SINGLE RESISTOR BEFORE CALCULATING TOTAL RESISTANCE.

'O' levels crash course program

III

OVERMUGGED

Professionally designed crash course to help you get a **condensed revision** before your 'O' Levels!

The **4 hour session** focuses on going through **key concepts** and **identifying commonly tested questions!**

Our **specialist tutors** will also impart valuable **exam pointers and tips** to help you maximise your preparation and ace your upcoming national exam!

The crash courses will begin in June 2021 and last till Oct 2021.

Pre-register now on our <u>website</u> and secure your slots!
